equity market update - Aug 2009

Equity Market Update

Domestic markets experienced a high level of uncertainty in the month of August with bullish sentiment stalled by inflation and Chinese markets. Benchmark indices ended almost flat for the month - Sensex closed at 15666.64, while Nifty gained 0.55% ending at 4662.10.

On the sector front, BSE realty gained 12.92%. Consumer durables was up 5.68% and IT was up 5.31%. FMCG faced the brunt of a deficient monsoon, slumping 6.74%. The mid-cap index (+5.6%) outperformed Sensex (-0.02%) but BSE small-cap index overshadowed all with a 12.75% rally.

FII inflows were \$1 billion in India equities, taking the 2009 total to \$8.32 billion. Inflows were \$2.28 billion in July.

Chinese stock market witnessed volatility and sporadically impacted markets across the globe. China's market recorded its second-biggest monthly loss (22%) in 15 years owing to dovish signals coming from the China's policy makers, hinting at possible credit tightening and curbs on production.

For the time being though, exports data negated such optimism, recording a tenth straight contraction over the year in July. Apr-June GDP growth (6.1% y-o-y) was encouraging enough for the bulls to keep faith in the India growth story. Markets continued with the hope of v-shaped or sustained recovery in developed economies.

The government signed a long-delayed Free Trade Agreement after more than six years of negotiation with the 10-country Southeast Asian bloc ASEAN. The agreement is expected to have a visible change in volume and direction of trade, and immensely benefit the export segment. After setting in motion the disinvestment process, the finance ministry unveiled the Direct Tax Code proposing radical reforms in Income Tax laws set to broaden the tax base. The bill is expected to be applicable from April 2011. The government also released a 5-year Foreign Trade Policy.

debt market update - Aug 2009

Debt Market Update

Persistent concerns over the government's massive borrowing schedule dragged bond prices to their lowest levels this year. The 10-year benchmark bond yield rose to 7.44%, up by over 40 bps in August, and over 200 bps since the January 2009 low. Bonds wilted under the pressure of medium-term liquidity and inflationary concerns. RBI acknowledged the risk of rising inflation. Bonds also witnessed a multiple of other headwinds in form of mixed overseas cues like sharp 2-way moves in US yields, higher commodity prices and comments from several policymakers that prompted volatility in absence of firm leads.

The mood remained bearish amid bond auctions almost every week. The market expected the bank to take more supportive steps to facilitate successful execution of the government's record borrowing programme. The waning appetite among investors was reflected across bond market segments with the shorter tenor yields also rising - cut-off yields for the 91-day treasury bill rates were up nearly 30 bps to 3.40% in August from July lows of 3.11%. The spread between the 1-year and 10-year benchmark yield narrowed to 276 bps from 326 bps in July. AAA 5-year bond yield jumped 30 bps but credit spread narrowed due to the sharper move in the underlying risk-free rate.

Rise in prices of primary articles pushed up the consumer price inflation (Industrial Workers) rate to 11.89% y-o-y in July, from 9.29% in June. The WPI stayed in negative (-0.95% y-o-y) on the back of high-base effect. PM warned of WPI escalating above the RBI's forecast of 5% by the end of the fiscal year as a poor monsoon drove up food costs.

fund objective

Provide high real rate of return in the long-term through high exposure to equity investments, while recognizing that there is significant probability of negative returns in the short-term. The risk appetite is 'high'.

fund manager's report

The allocation to gilts was increased to 58.70% from 54.93%. Accordingly we decreased the exposure in short term bank FDs, CDs and CPs to 41.30% from 45.07%.

target asset allocation

Government Securities: 100%

benchmark construction

I-Sec Composite Sovereign Bond Index:100%

growth of initial investment of Rs. 10,000 in AIP

fund objective

To achieve predictable investment return. This will be achieved through 100% investments in debt securities where returns are locked in through portfolio immunization techniques and use of rigorous Asset Liability Management (ALM). The risk appetite is 'low to moderate'.

- ✓ Macro Analysis
- ✓ Appreciation of Market Dynamics
- ✓ Meeting Investment Objectives vis-à-vis Risk Appetite
- ✓ Asset Allocation Strategy
- ✓ Security Selection – Portfolio Construction
- ✓ Benchmarks
- ✓ Risk Management/ Portfolio Evaluation/ Diagnostics
- ✓ Governance and Processes

Macro analysis of the economy is carried out by tracking the trends in key economic indicators.

Market dynamics are also studied apart from the above to determine our view of the changes likely in the interest rate scenario and equity market movements. Price movements in the market are monitored at all times along with factors that affect them such as the prevailing market sentiments, cash flows in the market and views/actions of key market participants including institutional investors like FIIs and mutual funds. For analyzing the debt markets, yield curve movements and changes in its shape are also studied.

The **risk appetite and investment objective** is clearly defined for each fund keeping in mind the investment horizon, liquidity requirements etc.

A range of acceptable holdings under each asset class is determined at the investment policy level. The **asset allocation** primarily takes into account, the investment objectives, regulatory issues and the likely risk return matrix to obtain a potential return which is the highest achievable for the risk that is assumed. Within the strategic asset allocation, the fund managers determine the weights of the various asset classes; primarily factoring in the developing market scenarios.

Based on the investment of objectives of each fund option, a rigorous **security selection** process is followed. The fixed income fund manager identifies cheaper securities across the yield curve and builds a basket of securities to arrive at the optimum level of yield within the range of pre-determined 'duration' for the entire portfolio after paying particular attention to the liquidity position and the liquidity premium on the securities. An active fund management style is followed or the equity portfolios. A core portfolio of stocks is first created driven by a top-down approach and a research based bottom-up stock selection method is followed.

Benchmarks are pre-determined for each fund based on the most appropriate indices available in the market or by constructing proxy benchmarks out of multiple indices. Performance of each fund is continuously tracked based on the benchmarks and recalibrated.

A statistical analysis is carried out to determine that the **risk levels** are in tune with the risk appetite of the particular fund. Statistical tools such as the standard tools such as the standard deviation and risk-adjusted return measures such as the Sharp ratio are calculated in order to compare the returns generated per unit of risk vis-à-vis benchmarks.

The investment policy has been designed by the **Board** to cover regulatory guidelines, the various product investment objectives, risk appetite strategic asset allocation and the investment style. It is ensured that the portfolio is always kept compliant with the relevant regulations. Our rigorous process and risk/compliance controls are well documented.

- ✓ Gross Fund Return
- ✓ Benchmark Return
- ✓ Fund Standard Deviation
- ✓ Fund Sharpe Ratio

► Gross Fund Return

Gross return for a fund is defined as the return calculated on an NAV basis plus the fund management fees which are debited periodically to the fund. We calculate gross fund returns in order to give uniformity while evaluating fund management performance as the fund management fees vary from company to company. Fund management charges are a matter of policy decision by the top management of a life insurance company. Hence, even if two funds from two different fund management companies give the same returns, the returns may not reflect that if they are calculated on an NAV basis.

We shall highlight this with the help of an example.

Reliance Life Insurance

Balanced Fund
NAV based Return=11.50 %
Fund Management Fee=2%
Gross Fund Return=13.50%

XYZ Insurance Company

Balanced Fund
NAV based Return=10.50%
Fund Management Fee=3%
Gross Fund Return=13.50%.

As seen above, though the gross return of both the companies were same, Reliance Life Insurance showed a higher NAV based return as the fund management fees were lower. Please note that the returns as given in The Analyst for all funds are computed on a gross basis.

► Benchmark Return

A benchmark is a standard against which the performance of an investment can be measured. Benchmarks are pre-determined primarily on the basis of the asset allocation structure of the fund.

Benchmarks can be readily available in the market or have to be constructed. The CNX Nifty is a readily available benchmark for our equity portfolio manager as the equity fund primarily invests in equities.

However, the benchmark for the Growth Fund of Reliance Life Insurance has been constructed as 60% of CRISIL Short Term Bond Index and 40% of CNX Nifty as the asset allocation of the growth fund is 60% of debt and 40% of equity. (Please refer to the Growth Fund page of The Analyst).

► Fund Standard Deviation

Risk of investing in a fund is identified by the volatility of the fund's periodic returns. Standard deviation measures the volatility of the fund's returns for a given time period.

In other words, Fund Standard Deviation for a particular time period gives us the deviation from the mean returns, that has occurred for that fund during that time period. For e.g. let us assume that the Balanced Fund has generated an average (mean) return of 11.55% for the last 2 years and that the corresponding standard deviation was 4.44%. That means that during the last 2 year time period, the balanced fund return varied between 15.99% (i.e. 11.55+ 4.44) and 7.11% (i.e. 11.55-4.44) during 65% of the time.

Higher the standard deviation, the greater the volatility, and therefore, the greater the risk of investing in that fund.

Thus, an investor has more information available at his disposal to evaluate the quality of performance of the fund and how volatile its returns are.

To carry it a step further, it is highly unlikely that a fund's return in any one year will be exactly the average. Rather, it will always be either higher or lower than the average. Thus, standard deviation teaches us to look beyond the "average annual return" figures that are touted by investment advisors.

► Fund Sharpe Ratio

Sharpe ratio of a fund tells us how much return the fund has been able to generate per unit of risk. The higher the Sharpe Ratio, the better the performance of a fund from a risk point of view.

The excess return generated by a fund for a particular time period is first calculated by subtracting the risk free rate from the rate of return generated by that fund during that time period. Dividing this result by the standard deviation of the fund return during that time period, one can obtain the Sharpe ratio.

Sharpe Ratio = Excess return / Annualized standard deviation of fund return

The "risk-free return" is the annualized return currently available on "risk-free" investments. This is usually assumed to be the return on a short government security like Treasury bill. A government security is sovereign credit which is the nearest to a risk free asset that one can get. For our calculations of the Sharpe ratios for all funds as given in the Analyst, we have assumed this risk free rate of interest to be at 5%.

- ✓ Benchmark Sharpe Ratio
- ✓ Modified Duration of Debt Portfolio
- ✓ Fund Beta

We shall assume that 9.85% was the annualized gross return for a 3-year time period for the balanced fund, 5% p.a. was the assumed risk free rate of return as discussed above and 4.14% p.a. was the standard deviation of this 3-year return. The Sharpe ratio can be calculated as follows:

$$(9.85-5)\%/4.14\%=1.17.$$

The Sharpe ratio tells us whether the returns of a portfolio are due to smart investment decisions or a result of excess risk. This measurement is very useful because although one portfolio or fund can reap higher returns than its peers, it is only a good investment if those higher returns do not come with too much additional risk. The greater a portfolio's Sharpe ratio, the better its risk-adjusted performance has been.

▶ Benchmark Sharpe Ratio

Just as the fund returns are compared to a benchmark return, the Sharpe ratio of the fund is also compared to the benchmark's Sharpe ratio in order to evaluate the risk-adjusted performance. In our example above, let us assume that the benchmark Sharpe ratio of the balanced fund for the last 3 years is 0.98. This means that over a three-year time period, the Balanced Fund of Reliance Life Insurance has given a higher risk-adjusted return than the comparable risk-adjusted return provided by the constructed benchmark.

While calculating the benchmark Sharpe ratio of 0.98, let us assume that 9.10% was the annualized gross return provided by the constructed benchmark for the balanced fund for the last 3-year time period, 5% p.a. was the assumed risk free rate of return, and 4.21% p.a. was the standard deviation of the 3-year benchmark return.

The benchmark Sharpe ratio for the Balanced Fund for the last three years has been calculated as follows:
 $(9.10-5)\%/4.21\%=0.98.$

▶ Modified Duration of Debt Portfolio

The value of a fund's debt portfolio is sensitive to changes in interest rates. When interest rates rise, bond prices fall, and vice versa. Generally, a debt portfolio comprising of bonds with higher maturities will have a higher price fluctuation than a portfolio comprising of bonds with lower maturities. Modified duration, indicates the sensitivity of the value of the debt portfolio to any given change in interest rates. Modified Duration is derived from Duration, which represents a weighted average of the time periods to maturity.

Modified Duration gives one an immediate rule of thumb -- the percentage change in the price of a bond is the duration multiplied by the change in interest rates. So, if a bond has duration of 10 years and interest rates fall from 8% to 7.5% (a drop of 0.50 percentage points), the bond's price will rise by approximately 5% (i.e. $10 \times 0.50\%$).

Let us assume that the modified duration for the Balanced Fund is 2.03. If interest rates drop from 8% to 7.5%, the value of this debt portfolio will rise by 1.015% (i.e. $2.03 \times 0.50\%$). Similarly, when interest rates rise from 8% to 8.5%, say, the value of this debt portfolio will fall by 1.015%.

▶ Fund Beta

Beta measures the risk of a security (say a particular stock) in relation to its broad market. The broad market is generally defined as the specified benchmark index. The Beta assigned to the benchmark index is 1. Beta of the stock describes the sensitivity of the price of the stock to the benchmark index. (For the more statistically inclined readers, Beta is the slope of the regression line). It is generally calculated for equity portfolio/funds.

If a stock has a beta of 1, that stock is likely to generate the same returns as the market. If the beta of a stock is more than 1, it means that the stock is likely to give higher returns compared to the market but also at a higher risk as compared to the market. For instance, a stock with beta of 1.2 means that when the market, say Nifty, gives a return of 10%, that stock is likely to generate returns of 12% (i.e. $1.2 \times 10\%$). Similarly, a low beta stock has given lower returns compared to what the market has delivered for a particular time period. For e.g. for a stock with beta of 0.80, if the Nifty gives returns of 10%, the stock is likely to give returns of only half of that, i.e. 8%. (i.e. $0.80 \times 10\%$)

Now we shall see the impact of these two stocks when the market falls. When the Nifty gives negative returns of 10%, i.e. the market falls by 10%, the price of the stock with beta of 1.2 will fall by 12%. However, though the price of the stock with the low beta of 0.8 will also fall when the market falls, it will not fall as much as the market. If the market falls by 10%, the price of this scrip will fall only by 8%.

The fund beta is nothing but the betas of individual stocks in the equity portfolio multiplied by the weight of that stock in the portfolio. If a fund has a high beta, the equity portfolio of that fund is aggressive and tilted towards high beta stocks and vice versa. Please note that the betas of individual stocks as given in the Equity Fund page of the Analyst have been calculated based on the available prices of the stocks on the NSE for the last 1-yr period.
