*CAGR: Compounded Annual Growth Rate

Macro Economic

India's real GDP grew 7.9% y-o-y the July-September quarter (Q2). GDP grew at 6.1% in the April-July quarter and at 5.8% in each of the preceding last two quarters. Agriculture and allied activities decelerated by 0.9% y-o-y in Q2 from 2.7% in Q2 FY09, while industry grew at 8.3% (6.1% in Q2 FY09) and services grew at 9.3% (9.8% in Q2 FY09).

IIP grew 10.3% y-o-y in October, slower than general market expectations of 12%. In September, IIP grew by 9.6% and in August, IIP grew by 10.4%. In April-October, the industrial sector grew 7.1% as compared with 4.3% the same period in FY09. Manufacturing grew 11.1% y-o-y in October against a drop of 0.6% a year ago, consumer durables output grew 21% (-1.6%), mining grew 8.2% (3.2%) and power generation grew 4.7% (4.4%).

India's current account deficit widened in July-Sept quarter to \$12.63 billion from \$5.99 billion in April-June. The deficit was \$12.58 billion in the July-Sept quarter of the FY09. Trade deficit for the quarter widened to \$32.2 billion, from \$26.02 billion in April-June. The RBI said the balance of payments surplus in the July-Sept quarter was \$9.42 billion, compared with a surplus of \$115 million in the April-June period. The balance of payments had a deficit of \$4.73 billion in the corresponding quarter a year earlier. Exports grew 18.2% y-o-y in November after registering declines for 13 straight months.

WPI inflation rate was up at 4.78% y-o-y in November while the food price index rose 18.65% y-o-y to December 19. Several forecasts believed that headline inflation might have exceeded RBI's fiscal year-end projection of 6.5% in December itself. Prices of staples like potatoes were higher by more than 125% as compared to the same period last year while vegetables, onions and pulses rose by more than 40%.

Besides inflation, the market also stayed wary of the deteriorating government finances. Fiscal deficit reached Rs. 3.06 trillion or 76% of the fiscal budget target in November 2009, while revenues had fallen short of targets. Tax receipts were Rs 2.33 trillion and total expenditure was Rs 6.22 trillion for the first eight months of 2009/10 fiscal year. The government completed more than 85% of the planned borrowing by December.

Debt Market Update

The 10-year benchmark yield climbed 50 bps to end at 7.69% in December compared 7.19% in the previous quarter. The yield touched an annual high of 7.75% from close to 5% levels at the beginning of 2009 while the 5-year yield rose to 7.22% from 5.12% during the year.

RBI provided ample cash conditions to the money market with banks parking over a trillion rupees at the LAF reverse repos auctions consistently in the last three quarters. Slower than expected credit growth (growing at around 11% levels against RBI target of 17%) ensured ample liquidity.

Robust Q2 GDP growth and rising inflation increased pressure on bonds in the last couple of months. Surplus liquidity supported short-term yields but long-term yields rose faster, leading to a steeper yield curve. RBI sent out signals to prepare the market for the reversal of monetary policy by raising the SLR back to 25%. The gap between 2-year and 10-year yield widened to above 200 bps from 140 bps in the last quarter.

The rate futures segment launched on the NSE in August failed to pick up steam while anticipated progress on repo in corporate bonds failed to arrive.

AAA 5-year yield ended at 8.34% from 8.45% at the end of the previous quarter. The yield eased from the high of 9% in March, but was up 115 bps from the low of 7.22% in April. Credit spread narrowed to 72 bps from a peak of 327 bps. Short-term 1-year CD rate that touched 8.60%, currently hover just below 6% levels, offering a spread of only 18 bps over the treasury bills, down from 215 bps in March.

Outlook

During the month, yields will remain under pressure. We expect the 10yr Benchmark G-sec to remain in the range of 7.75-7.50%. Monthly Inflation figures will be keenly watched during the month. We expect it to continue its upward trend. Going forward, we expect the liquidity situation to remain comfortable. The spread between G-sec and corporate bonds is expected to remain at the current levels. Monetary policy stance by the Central bank will decide the course of the market for the remaining part of the fiscal.

Equity Market Update

Indian equity market was on a roll in 2009 as benchmark indices posted the best ever yearly performance in 18 years in sharp contrast to 2008. Sensex closed with an impressive gain of 81.03% at 17464.81 while Nifty ended 75.76% higher at 5201.05 from last year.

FII inflows into Indian equities totaled Rs. 24807.10 crore in Oct-Dec. FIIs flocked back to the India growth story with inflows of over a record Rs 80,000 crore in 2009 after pulling out over Rs. 52,000 crore in 2008. Investors shrugged off the doubts posed by the Satyam fiasco early in the year. A stable government at the Center improved sentiment and outlook over reforms like disinvestment, GST, Direct Tax Code and FDI in certain sectors.

FDI inflow was flat for Apr-Nov if compared with the previous fiscal but this was because of a strong rebound in November (+60% y-o-y) and October (+56%). Exports reversed the decline of 13 straight months, and grew 18.2% y-o-y in November. October IIP grew 10.3% y-o-y as compared to 9.6% in September. Auto and cement segments showed surge in sales.

In the Oct-Dec quarter, Sensex gained 1.97% and Nifty gained 2.30%. Among the sectors, metals outperformed with gains over 22% backed by surge in base metal prices followed by healthcare and IT with gains of over 13% each. However, realty plunged 14.50%. Oil & gas also closed marginally lower. Smaller cap indices gained attention due to valuation concerns in large caps. BSE small cap surged 10.11% while BSE Midcap gained 6.22%.

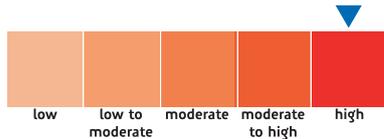

Outlook

Markets in the last quarter were primarily driven by liquidity with the nifty benchmark gaining 2.32%. Most of the upgrades in results are already factored in by the markets. Going forward, we expect the next quarter again to be driven primarily by liquidity. The market would be keenly watching the RBI credit policy expected at the end of January. Any increase in benchmark rates or tightening of reserve ratios can be negative for interest rate sensitive stocks. Another factor which will be keenly tracked by the market would be the dollar index movement. Overall, we expect some selective stock performance in the market with the broader market trading in a zone.

fund objective

Provide high real rate of return in the long-term through high exposure to equity investments, while recognizing that there is significant probability of negative returns in the short-term. The risk appetite is 'high'.

fund manager's report

The month of December saw the markets ending positive. The markets took support from positive foreign inflows and increase in liquidity globally. Looking at the positive data from specific sectors, the holding in equities was kept at 71.41%.

The exposure in gilts was decreased to 2.72% from 2.90% on expectations of hardening of yield curve. The exposure to corporate bonds was increased to 5.98% from 4.70% to take the advantage of higher spread. Accordingly the exposure to short term assets like CDs and MFs has been decreased to 19.89% from 21.65% as exposure in bonds has been increased

fund manager's report

The month of December saw the markets ending positive. The markets took support from positive foreign inflows and increase in liquidity globally. Looking at the positive data from specific sectors, the holding in equities was kept at 17.95%.

The allocation to gilts was decreased to 8.42% from 10.37% on expectations of hardening of yield curve. The exposure in corporate bonds was increased to 50.15% from 49.71% to take the advantage of higher spread. Accordingly, exposure in short-term bank deposits and CDs/CPs has been increased to 23.49% from 22.40%.

fund manager's report

The exposure to corporate bonds was increased to 71.81% from 66.89% to take the advantage of higher spread. Exposure in gilts was increased to 5.93% from 3.15%. Balance was invested in short term bank FDs, CDs and CPs. We intend to increase the exposure to corporate bonds to 80-90% as and when attractive investments are available.

fund manager's report

The exposure to gilts was decreased to 8.72% from 9.08% on expectations of hardening of yield curve. Exposure to corporate bonds was increased to 57.70% from 57.25% to take the advantage of higher spread. Accordingly the exposure to short term assets was decreased to 33.58% from 33.67%. We will increase exposure to gilts and corporate bonds as and when attractive investments are available.

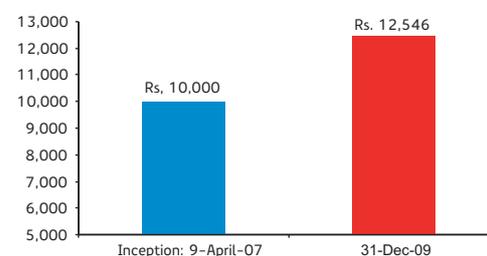

target asset allocation

Debt Instruments: 100%

benchmark construction

CRISIL Composite Bond Index: 100%

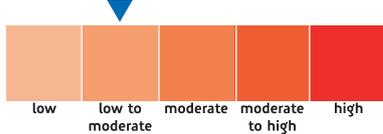

growth of initial investment of Rs. 10,000 in MGP

fund objective

Provide returns that exceed the inflation rate, without taking any credit risk (sovereign risk only) and maintaining a low probability of negative return in the short-term. The risk appetite is 'low to moderate'.

- ✓ Macro Analysis
- ✓ Appreciation of Market Dynamics
- ✓ Meeting Investment Objectives vis-à-vis Risk Appetite
- ✓ Asset Allocation Strategy
- ✓ Security Selection – Portfolio Construction
- ✓ Benchmarks
- ✓ Risk Management/ Portfolio Evaluation/ Diagnostics
- ✓ Governance and Processes

Macro analysis of the economy is carried out by tracking the trends in key economic indicators.

Market dynamics are also studied apart from the above to determine our view of the changes likely in the interest rate scenario and equity market movements. Price movements in the market are monitored at all times along with factors that affect them such as the prevailing market sentiments, cash flows in the market and views/actions of key market participants including institutional investors like FIIs and mutual funds. For analyzing the debt markets, yield curve movements and changes in its shape are also studied.

The **risk appetite and investment objective** is clearly defined for each fund keeping in mind the investment horizon, liquidity requirements etc.

A range of acceptable holdings under each asset class is determined at the investment policy level. The **asset allocation** primarily takes into account, the investment objectives, regulatory issues and the likely risk return matrix to obtain a potential return which is the highest achievable for the risk that is assumed. Within the strategic asset allocation, the fund managers determine the weights of the various asset classes; primarily factoring in the developing market scenarios.

Based on the investment of objectives of each fund option, a rigorous **security selection** process is followed. The fixed income fund manager identifies cheaper securities across the yield curve and builds a basket of securities to arrive at the optimum level of yield within the range of pre-determined 'duration' for the entire portfolio after paying particular attention to the liquidity position and the liquidity premium on the securities. An active fund management style is followed or the equity portfolios. A core portfolio of stocks is first created driven by a top-down approach and a research based bottom-up stock selection method is followed.

Benchmarks are pre-determined for each fund based on the most appropriate indices available in the market or by constructing proxy benchmarks out of multiple indices. Performance of each fund is continuously tracked based on the benchmarks and recalibrated.

A statistical analysis is carried out to determine that the **risk levels** are in tune with the risk appetite of the particular fund. Statistical tools such as the standard tools such as the standard deviation and risk-adjusted return measures such as the Sharp ratio are calculated in order to compare the returns generated per unit of risk vis-à-vis benchmarks.

The investment policy has been designed by the **Board** to cover regulatory guidelines, the various product investment objectives, risk appetite strategic asset allocation and the investment style. It is ensured that the portfolio is always kept compliant with the relevant regulations. Our rigorous process and risk/compliance controls are well documented.

- ✓ Gross Fund Return
- ✓ Benchmark Return
- ✓ Fund Standard Deviation
- ✓ Fund Sharpe Ratio

► Gross Fund Return

Gross return for a fund is defined as the return calculated on an NAV basis plus the fund management fees which are debited periodically to the fund. We calculate gross fund returns in order to give uniformity while evaluating fund management performance as the fund management fees vary from company to company. Fund management charges are a matter of policy decision by the top management of a life insurance company. Hence, even if two funds from two different fund management companies give the same returns, the returns may not reflect that if they are calculated on an NAV basis.

We shall highlight this with the help of an example.

Reliance Life Insurance

Balanced Fund
NAV based Return=11.50 %
Fund Management Fee=2%
Gross Fund Return=13.50%

XYZ Insurance Company

Balanced Fund
NAV based Return=10.50%
Fund Management Fee=3%
Gross Fund Return=13.50%.

As seen above, though the gross return of both the companies were same, Reliance Life Insurance showed a higher NAV based return as the fund management fees were lower. Please note that the returns as given in The Analyst for all funds are computed on a gross basis.

► Benchmark Return

A benchmark is a standard against which the performance of an investment can be measured. Benchmarks are pre-determined primarily on the basis of the asset allocation structure of the fund.

Benchmarks can be readily available in the market or have to be constructed. The CNX Nifty is a readily available benchmark for our equity portfolio manager as the equity fund primarily invests in equities.

However, the benchmark for the Growth Fund of Reliance Life Insurance has been constructed as 60% of CRISIL Short Term Bond Index and 40% of CNX Nifty as the asset allocation of the growth fund is 60% of debt and 40% of equity. (Please refer to the Growth Fund page of The Analyst).

► Fund Standard Deviation

Risk of investing in a fund is identified by the volatility of the fund's periodic returns. Standard deviation measures the volatility of the fund's returns for a given time period.

In other words, Fund Standard Deviation for a particular time period gives us the deviation from the mean returns, that has occurred for that fund during that time period. For e.g. let us assume that the Balanced Fund has generated an average (mean) return of 11.55% for the last 2 years and that the corresponding standard deviation was 4.44%. That means that during the last 2 year time period, the balanced fund return varied between 15.99% (i.e. 11.55+ 4.44) and 7.11% (i.e. 11.55-4.44) during 65% of the time.

Higher the standard deviation, the greater the volatility, and therefore, the greater the risk of investing in that fund.

Thus, an investor has more information available at his disposal to evaluate the quality of performance of the fund and how volatile its returns are.

To carry it a step further, it is highly unlikely that a fund's return in any one year will be exactly the average. Rather, it will always be either higher or lower than the average. Thus, standard deviation teaches us to look beyond the "average annual return" figures that are touted by investment advisors.

► Fund Sharpe Ratio

Sharpe ratio of a fund tells us how much return the fund has been able to generate per unit of risk. The higher the Sharpe Ratio, the better the performance of a fund from a risk point of view.

The excess return generated by a fund for a particular time period is first calculated by subtracting the risk free rate from the rate of return generated by that fund during that time period. Dividing this result by the standard deviation of the fund return during that time period, one can obtain the Sharpe ratio.

Sharpe Ratio = Excess return / Annualized standard deviation of fund return

The "risk-free return" is the annualized return currently available on "risk-free" investments. This is usually assumed to be the return on a short government security like Treasury bill. A government security is sovereign credit which is the nearest to a risk free asset that one can get. For our calculations of the Sharpe ratios for all funds as given in the Analyst, we have assumed this risk free rate of interest to be at 5%.

- ✓ Benchmark Sharpe Ratio
- ✓ Modified Duration of Debt Portfolio
- ✓ Fund Beta

We shall assume that 9.85% was the annualized gross return for a 3-year time period for the balanced fund, 5% p.a. was the assumed risk free rate of return as discussed above and 4.14% p.a. was the standard deviation of this 3-year return. The Sharpe ratio can be calculated as follows:

$$(9.85-5)\%/4.14\%=1.17.$$

The Sharpe ratio tells us whether the returns of a portfolio are due to smart investment decisions or a result of excess risk. This measurement is very useful because although one portfolio or fund can reap higher returns than its peers, it is only a good investment if those higher returns do not come with too much additional risk. The greater a portfolio's Sharpe ratio, the better its risk-adjusted performance has been.

▶ Benchmark Sharpe Ratio

Just as the fund returns are compared to a benchmark return, the Sharpe ratio of the fund is also compared to the benchmark's Sharpe ratio in order to evaluate the risk-adjusted performance. In our example above, let us assume that the benchmark Sharpe ratio of the balanced fund for the last 3 years is 0.98. This means that over a three-year time period, the Balanced Fund of Reliance Life Insurance has given a higher risk-adjusted return than the comparable risk-adjusted return provided by the constructed benchmark.

While calculating the benchmark Sharpe ratio of 0.98, let us assume that 9.10% was the annualized gross return provided by the constructed benchmark for the balanced fund for the last 3-year time period, 5% p.a. was the assumed risk free rate of return, and 4.21% p.a. was the standard deviation of the 3-year benchmark return.

The benchmark Sharpe ratio for the Balanced Fund for the last three years has been calculated as follows:
 $(9.10-5)\%/4.21\%=0.98.$

▶ Modified Duration of Debt Portfolio

The value of a fund's debt portfolio is sensitive to changes in interest rates. When interest rates rise, bond prices fall, and vice versa. Generally, a debt portfolio comprising of bonds with higher maturities will have a higher price fluctuation than a portfolio comprising of bonds with lower maturities. Modified duration, indicates the sensitivity of the value of the debt portfolio to any given change in interest rates. Modified Duration is derived from Duration, which represents a weighted average of the time periods to maturity.

Modified Duration gives one an immediate rule of thumb -- the percentage change in the price of a bond is the duration multiplied by the change in interest rates. So, if a bond has duration of 10 years and interest rates fall from 8% to 7.5% (a drop of 0.50 percentage points), the bond's price will rise by approximately 5% (i.e. $10 \times 0.50\%$).

Let us assume that the modified duration for the Balanced Fund is 2.03. If interest rates drop from 8% to 7.5%, the value of this debt portfolio will rise by 1.015% (i.e. $2.03 \times 0.50\%$). Similarly, when interest rates rise from 8% to 8.5%, say, the value of this debt portfolio will fall by 1.015%.

▶ Fund Beta

Beta measures the risk of a security (say a particular stock) in relation to its broad market. The broad market is generally defined as the specified benchmark index. The Beta assigned to the benchmark index is 1. Beta of the stock describes the sensitivity of the price of the stock to the benchmark index. (For the more statistically inclined readers, Beta is the slope of the regression line). It is generally calculated for equity portfolio/funds.

If a stock has a beta of 1, that stock is likely to generate the same returns as the market. If the beta of a stock is more than 1, it means that the stock is likely to give higher returns compared to the market but also at a higher risk as compared to the market. For instance, a stock with beta of 1.2 means that when the market, say Nifty, gives a return of 10%, that stock is likely to generate returns of 12% (i.e. $1.2 \times 10\%$). Similarly, a low beta stock has given lower returns compared to what the market has delivered for a particular time period. For e.g. for a stock with beta of 0.80, if the Nifty gives returns of 10%, the stock is likely to give returns of only half of that, i.e. 8%. (i.e. $0.80 \times 10\%$)

Now we shall see the impact of these two stocks when the market falls. When the Nifty gives negative returns of 10%, i.e. the market falls by 10%, the price of the stock with beta of 1.2 will fall by 12%. However, though the price of the stock with the low beta of 0.8 will also fall when the market falls, it will not fall as much as the market. If the market falls by 10%, the price of this scrip will fall only by 8%.

The fund beta is nothing but the betas of individual stocks in the equity portfolio multiplied by the weight of that stock in the portfolio. If a fund has a high beta, the equity portfolio of that fund is aggressive and tilted towards high beta stocks and vice versa. Please note that the betas of individual stocks as given in the Equity Fund page of the Analyst have been calculated based on the available prices of the stocks on the NSE for the last 1-yr period.
