**Indian Economy**

Government has continued to tread the path of reform. Deregulation of price of bulk diesel sales, increase in limit of debt investment by foreign investors by US\$ 5billion and allowing Repo in corporate bonds were the major highlights. The actual fiscal numbers released till December 2012 has indicated that government was bringing down expenditure and thus might be able to achieve the fiscal deficit target of 5.3% of GDP for FY13.

The Reserve Bank of India (RBI) has reduced Repo rate and Cash Reserve Ratio (CRR) by 25 bps in its 3Q policy review. It was the second Repo rate cut after 9 months. It is now expected that banks would be lowering lending rates.

**Debt Market**

India's Industrial production (IIP) contracted by -0.1% y-o-y in November 2012 after expanding by 8.2% in October 2102 due to base effect. WPI Inflation further softened to 7.18% for December 2012 as compared to 7.24% for November 2012, while core inflation was stable near 4%. Yield on benchmark 10Y Government Bond has eased to lows of 7.82% due to reduction in policy rates. However, due to persistent tight liquidity, despite release of cash by RBI, yield on short and medium maturity corporate bonds inched up marginally

**Debt Outlook:**

We expect there would be shortfall in revenue collection in FY 13 and thus fiscal deficit would widen. This could be bridged by issuing short maturity Treasury Bills. The fiscal deficit for FY14 is expected to be around 4.8% -5.0% of GDP, which would depend upon assumption of growth in GDP and inflation in the budget. This would result in nearly similar amount of borrowing program as we have witnessed in FY 13. Going forward, interest rates are expected to be range bounded.

**Equity Market**

While we did not exactly witness a January effect in Indian equities, the positive sentiment at the end of last year seemed to have spilled over to the other side of the holiday season. Although skeptics would argue that these are still early days, we witnessed quite a few firsts during the month - ranging from diesel price deregulation to Finance Minister global road shows. With growth remaining tepid and inflation beginning to inch lower, the RBI has also decided to play the piper and cut benchmark rates. Meanwhile the corporate earnings season started on an ebullient note with heavyweights like Infosys and Reliance surprising positively. All in all, January was a month of many flavors and it shall be interesting to see which ones linger on the longest. Benchmark Sensex was up by 2.41% in January.

**Growth:** After the strong turnout in Oct 2102, Index of Industrial Production for Nov 2102 once again came in lower at -0.1%. The low reading was driven by base effect as well as the expected decline in sales post the festive season. In terms of use-based classification, cap goods went back into a contraction (-7.7%) while Consumer Goods were almost flat (+1%).

**Reforms and Road shows:** Jan 2102 marked a red letter month for reforms with the government getting its first break on the contentious issue of diesel price deregulation - by allowing OMCs to raise diesel prices in small steps every month going forward. While implementation will still remain key for this, the announcement was cheered on by the markets and we saw a re-rating of the OMC pack in a single trading session. The other highlight was the Finance Minister going on a road show to meet foreign investors across geographies. This appeared to have been taken in a positive light with the high-level contingent sounding convincingly optimistic and clarifying investor concerns on regulations and the economy.

**Equity Outlook:**

The Outlook in the near term is positive with markets are keenly watching whether the government is able to reign in the fiscal deficit in the range of 5.1% to 5.3% in FY13. The tone of the forthcoming budget for FY14, whether a populist or the one which consolidates the fiscal, set the path for the market.

## ✓ Macro Analysis

## ✓ Appreciation of Market Dynamics

## ✓ Meeting Investment Objective vis-à-vis Risk Appetite

## ✓ Asset Allocation Strategy

## ✓ Security Selection- Portfolio Constriction

## ✓ Benchmark

## ✓ Risk Management / Portfolio Evolution/ Diagnostics

## ✓ Governance and Process

**Macro analysis** of the economy is carried out by tracking the trends in key economic indicators.

**Market dynamics** are also studied apart from the above to determine our view of the changes likely in the interest rate scenario and equity market movements. Price movements in the market are monitored at all times along with factors that affect them such as the prevailing market sentiments, cash flows in the market and views/actions of key market participants including institutional investors like FIIs and mutual funds. For analyzing the debt markets, yield curve movements and changes in its shape are also studied.

The **risk appetite and investment objective** is clearly defined for each fund keeping in mind the investment horizon, liquidity requirements etc.

A range of acceptable holdings under each asset class is determined at the investment policy level. The **asset allocation** primarily takes into account, the investment objectives, regulatory issues and the likely risk return matrix to obtain a potential return which is the highest achievable for the risk that is assumed. Within the strategic asset allocation, the fund managers determine the weights of the various asset classes; primarily factoring in the developing market scenarios.

Based on the investment of objectives of each fund option, a rigorous **security selection** process is followed. The fixed income fund manager identifies cheaper securities across the yield curve and builds a basket of securities to arrive at the optimum level of yield within the range of pre-determined 'duration' for the entire portfolio after paying particular attention to the liquidity position and the liquidity premium on the securities. An active fund management style is followed on the equity portfolios. A core portfolio of stocks is first created driven by a top-down approach and a research based bottom-up stock selection method is followed.

**Benchmarks** are pre-determined for each fund based on the most appropriate indices available in the market or by constructing proxy benchmarks out of multiple indices. Performance of each fund is continuously tracked based on the benchmarks and recalibrated.

A statistical analysis is carried out to determine that the **risk levels** are in tune with the risk appetite of the particular fund. Statistical tools such as the standard deviation and risk-adjusted return measures such as the Sharp ratio are calculated in order to compare the returns generated per unit of risk vis-à-vis benchmarks.

The investment policy has been designed by the **Board** to cover regulatory guidelines, the various product investment objectives, risk appetite strategic asset allocation and the investment style. It is ensured that the portfolio is always kept compliant with the relevant regulations. Our rigorous process and risk/compliance controls are well documented.

## Gross Fund Return

Gross return for a fund is defined as the return calculated on an NAV basis plus the fund management fees which are debited periodically to the fund. We calculate gross fund returns in order to give uniformity while evaluating fund management performance as the fund management fees vary from company to company. Fund management charges are a matter of policy decision by the top management of a life insurance company. Hence, even if two funds from two different fund management companies give the same returns, the returns may not reflect that if they are calculated on an NAV basis.

**We shall highlight this with the help of an example.**

### Reliance Life Insurance

Balanced Fund  
NAV based Return=11.50 %  
Fund Management Fee=2%  
Gross Fund Return=13.50%

### XYZ Insurance Company

Balanced Fund  
NAV based Return=10.50%  
Fund Management Fee=3%  
Gross Fund Return=13.50%.

As seen above, though the gross return of both the companies were same, Reliance Life Insurance showed a higher NAV based return as the fund management fees were lower. Please note that the returns as given in The Analyst for all funds are computed on a gross basis.

## Benchmark Return

A benchmark is a standard against which the performance of an investment can be measured. Benchmarks are pre-determined primarily on the basis of the asset allocation structure of the fund.

Benchmarks can be readily available in the market or have to be constructed. The CNX Nifty is a readily available benchmark for our equity portfolio manager as the equity fund primarily invests in equities.

However, the benchmark for the Growth Fund of Reliance Life Insurance has been constructed as 60% of CRISIL Short Term Bond Index and 40% of CNX Nifty as the asset allocation of the growth fund is 60% of debt and 40% of equity. (Please refer to the Growth Fund page of The Analyst).

## Fund Standard Deviation

Risk of investing in a fund is identified by the volatility of the fund's periodic returns. Standard deviation measures the volatility of the fund's returns for a given time period.

In other words, Fund Standard Deviation for a particular time period gives us the deviation from the mean returns, that has occurred for that fund during that time period. For e.g. let us assume that the Balanced Fund has generated an average (mean) return of 11.55% for the last 2 years and that the corresponding standard deviation was 4.44%. That means that during the last 2 year time period, the balanced fund return varied between 15.99% (i.e. 11.55+ 4.44) and 7.11% (i.e. 11.55-4.44) during 65% of the time.

Higher the standard deviation, the greater the volatility, and therefore, the greater the risk of investing in that fund.

Thus, an investor has more information available at his disposal to evaluate the quality of performance of the fund and how volatile its returns are.

To carry it a step further, it is highly unlikely that a fund's return in any one year will be exactly the average. Rather, it will always be either higher or lower than the average. Thus, standard deviation teaches us to look beyond the "average annual return" figures that are touted by investment advisors.

## Fund Sharpe Ratio

Sharpe ratio of a fund tells us how much return the fund has been able to generate per unit of risk. The higher the Sharpe Ratio, the better the performance of a fund from a risk point of view.

The excess return generated by a fund for a particular time period is first calculated by subtracting the risk free rate from the rate of return generated by that fund during that time period. Dividing this result by the standard deviation of the fund return during that time period, one can obtain the Sharpe ratio.

**Sharpe Ratio = Excess return / Annualized standard deviation of fund return**

The "risk-free return" is the annualized return currently available on "risk-free" investments. This is usually assumed to be the return on a short government security like Treasury bill. A government security is sovereign credit which is the nearest to a risk free asset that one can get. For our calculations of the Sharpe ratios for all funds as given in the Analyst, we have assumed this risk free rate of interest to be at 5%.

✓ Gross Fund Return

✓ Benchmark Return

✓ Fund Standard Deviation

✓ Fund Sharpe Ratio

We shall assume that 9.85% was the annualized gross return for a 3-year time period for the balanced fund, 5% p.a. was the assumed risk free rate of return as discussed above and 4.14% p.a. was the standard deviation of this 3-year return. The Sharpe ratio can be calculated as follows:

$$(9.85-5)\%/4.14\%=1.17.$$

The Sharpe ratio tells us whether the returns of a portfolio are due to smart investment decisions or a result of excess risk. This measurement is very useful because although one portfolio or fund can reap higher returns than its peers, it is only a good investment if those higher returns do not come with too much additional risk. The greater a portfolio's Sharpe ratio, the better its risk-adjusted performance has been.

**Benchmark Sharpe Ratio**

Just as the fund returns are compared to a benchmark return, the Sharpe ratio of the fund is also compared to the benchmark's Sharpe ratio in order to evaluate the risk-adjusted performance. In our example above, let us assume that the benchmark Sharpe ratio of the balanced fund for the last 3 years is 0.98. This means that over a three-year time period, the Balanced Fund of Reliance Life Insurance has given a higher risk-adjusted return than the comparable risk-adjusted return provided by the constructed benchmark.

While calculating the benchmark Sharpe ratio of 0.98, let us assume that 9.10% was the annualized gross return provided by the constructed benchmark for the balanced fund for the last 3-year time period, 5% p.a. was the assumed risk free rate of return, and 4.21% p.a. was the standard deviation of the 3-year benchmark return.

The benchmark Sharpe ratio for the Balanced Fund for the last three years has been calculated as follows:  $(9.10-5)\%/4.21\%=0.98.$

**Modified Duration of Debt Portfolio**

The value of a fund's debt portfolio is sensitive to changes in interest rates. When interest rates rise, bond prices fall, and vice versa. Generally, a debt portfolio comprising of bonds with higher maturities will have a higher price fluctuation than a portfolio comprising of bonds with lower maturities. Modified duration, indicates the sensitivity of the value of the debt portfolio to any given change in interest rates. Modified Duration is derived from Duration, which represents a weighted average of the time periods to maturity.

Modified Duration gives one an immediate rule of thumb -- the percentage change in the price of a bond is the duration multiplied by the change in interest rates. So, if a bond has duration of 10 years and interest rates fall from 8% to 7.5% (a drop of 0.50 percentage points), the bond's price will rise by approximately 5% (i.e.  $10 \times 0.50\%$ ).

Let us assume that the modified duration for the Balanced Fund is 2.03. If interest rates drop from 8% to 7.5%, the value of this debt portfolio will rise by 1.015% (i.e.  $2.03 \times 0.50\%$ ). Similarly, when interest rates rise from 8% to 8.5%, say, the value of this debt portfolio will fall by 1.015%.

**Fund Beta**

Beta measures the risk of a security (say a particular stock) in relation to its broad market. The broad market is generally defined as the specified benchmark index. The Beta assigned to the benchmark index is 1. Beta of the stock describes the sensitivity of the price of the stock to the benchmark index. (For the more statistically inclined readers, Beta is the slope of the regression line). It is generally calculated for equity portfolio/funds.

If a stock has a beta of 1, that stock is likely to generate the same returns as the market. If the beta of a stock is more than 1, it means that the stock is likely to give higher returns compared to the market but also at a higher risk as compared to the market. For instance, a stock with beta of 1.2 means that when the market, say Nifty, gives a return of 10 %, that stock is likely to generate returns of 12% ( i.e.  $1.2*10\%$ ). Similarly, a low beta stock has given lower returns compared to what the market has delivered for a particular time period. For e.g. for a stock with beta of 0.80, if the Nifty gives returns of 10%, the stock is likely to give returns of only half of that, i.e. 8%. (i.e.  $0.80*10\%$ )

Now we shall see the impact of these two stocks when the market falls. When the Nifty gives negative returns of 10%, i.e the market falls by 10%, the price of the stock with beta of 1.2 will fall by 12%. However, though the price of the stock with the low beta of 0.8 will also fall when the market falls, it will not fall as much as the market. If the market falls by 10%, the price of this scrip will fall only by 8%.

The fund beta is nothing but the betas of individual stocks in the equity portfolio multiplied by the weight of that stock in the portfolio. If a fund has a high beta, the equity portfolio of that fund is aggressive and tilted towards high beta stocks and vice versa. Please note that the betas of individual stocks as given in the Equity Fund page of the Analyst have been calculated based on the available prices of the stocks on the NSE for the last 1-yr period.
