Indian Economy

Central Government was able to contain fiscal deficit to 5.2% & projected to improve it to 4.8% for FY 13 & FY 14 respectively. This was mainly on account of lowering of expenditures in the current financial year and buoyancy in the revenue collection in the next year. In order to fund fiscal deficit, the borrowing program for the next year entails higher issuance of bonds in comparison to this year. This also involves preemptive purchase of bonds maturing in FY 15- 17 for INR 500 billion to alleviate pressure of maturity in those years.

The theme came out clearly from the recent budget is emphasis on the fiscal consolidation in order to promote economy and try to send strong message to global investors that we are taking measures to maintain our credit worthiness.

3QFY13 GDP has been came out at dismal 4.5%. The main drivers were all around poor growth and lower external demand. India's Industrial production (IIP) contracted by 0.6% y-o-y in December 12 compared to -0.8% in November 12. Latest trend in Manufacturing PMI index indicates that expansion in economy is stable though pricing power still exists. In addition, Current Account Deficit (CAD) remains a high point of concern due to continuation of slackening in exports and growth in imports. Though government is taking measures to curb demand for gold, it will take a while before combination of higher duty, lower inflation and stable to lower gold prices will deter buyers. Once CAD stabilizes, then one can expect stabilization in USD/INR as well as persistent lower interest rates.

Trend in Inflation continue to be benign. WPI has softened further to 6.62% for January13 as compared to 7.18% for December 12. In line, core inflation has also declined further to 4.12% in January13 from 4.24% in December 12. However, CPI continues to be in double digit where weights are inclined more to primary articles. It is expected that WPI may soften further on account of range bound global commodity prices and improved supplies of agricultural products during the winter.

Fixed Income Markets

Interest rates have gone up marginally after the reduction in policy rates at the start of the month. However, interest rates have stabilized with the cancellation of a tranche of government bond issuance as well as buy back of bonds to improve liquidity. Later, interest rate moved up again marginally with higher than expected announcement of borrowing program for FY14. In all, movement was restricted in the band of 10 bps.

Similarly y0ield of AAA rated bonds also inched up much higher than Government bonds. This has resulted in widening of the spreads to 85 bps from 65 bps. Issuers were making last month trip to bond markets to complete its borrowing program for the year. This has also created pressures on corporate bond yield.

Banks were also offering better deposit rates to attract large funds to full fill its target for the year. Money Market rates also firmed up due to tight banking liquidity as well as government holding large cash to contain expenditures. It is expected that liquidity will improve by the onset of next month, which will help lowering in short term interest rates.

Globally, interest rates continue to be benign though camps are divided between the continuance of the Quantitative Easing (QE) in USA and its long term impact on the inflation. Japan is determined to pursue QE resolutely to let inflation reach to target of 2%. EURO area was witnessing some banks returning its LTRO funds mostly from the strong northern regions.

Fixed Income Outlook:

Going forward, it is expected that in near term, in continuation with easing bias, one can expected further reduction in policy rates in ensuing monetary policy in March 13 as we continuing to witness lower demand, for example, decade low car sales as well as hardly any capital expenditures. Though it will take a while, before policy action taken by government will improve CAD and other economic indicators. In the medium term once borrowing by the government starts in the new financial year, it will add pressure on the interest rates marginally.

Equity Market

After seeing off a slow start to the year in January 13, Indian equities were in for a month of weakness in February 13 (Nifty down by 5.7%). There were early signs during the month with the corporate earnings failing to live up to the strong start. While the Union Budget due on the last trading day of the month was on everyone's mind, events like macro releases, index rebalancing and M&A announcements kept investors on their toes all through the month. The Budget however, failed to cheer the market in the absence of any big-bang reforms even as the fiscal math seemed to add up. Global cues were also back in focus this month with Italy facing the prospect of a hung parliament and debate about continuance of quantitative easing in the US.

Growth: Dec IIP disappointed the market coming in at -0.6%. Primary factors contributing to this contraction were a 4% decline in mining - reflecting clearance issues and a decline in manufacturing with several sub-sectors in the red. The 3QFY13 GDP growth also came much weaker than expected at 4.5%.

Budget: The much-awaited Union Budget drew a mixed reaction from stakeholders. While the arithmetic seemed to be in place, investors were left asking for more on the reforms front. To compound the woes, a statement making Tax Residency Certificates (TRCs) a necessary but not a sufficient condition for claiming benefits under Double Tax Avoidance Agreements (DTAA) saw some impulsive selling from foreign investors. In terms of sectors, the extension of interest subvention on agricultural credit was seen as a positive for private banks and the subsidy sharing formula appeared to cap the burden for upstream companies. There were also some measures announced to boost investments - roads, manufacturing etc. and savings - house loans, inflation-indexed instruments etc.

Fiscal: With the Budget as a backdrop, all eyes were on the government's ability to get the fiscal math in order. The NTPC and Oil India divestments aided in this process taking the FY13 proceeds to Rs215bn (revised target Rs240bn). Meanwhile, the telecom auction for unsold spectrum which was lined up for Mar proved to be damp squib with none of the operators submitting applications. However given the cutback in Plan Expenditure, the government managed to restrain the fiscal deficit number for FY13 at an impressive 5.2%. The FY14 divestment target has been set at Rs558bn of which Rs140bn is expected to be raised from stake sales in non-government companies (SUUTI stakes, Hindustan Zinc and BALCO).

Equity Outlook:

Equity valuations are attractive for long term savers to continue to stay invested in the equities to build their nest egg.

Macro analysis of the economy is carried out by tracking the trends in key economic indicators.

Market dynamics are also studied apart from the above to determine our view of the changes likely in the interest rate scenario and equity market movements. Price movements in the market are monitored at all times along with factors that affect them such as the prevailing market sentiments, cash flows in the market and views/actions of key market participants including institutional investors like FII and mutual funds. For analyzing the debt markets, yield curve movements and changes in its shape are also studied.

The **risk appetite and investment objective** is clearly defined for each fund keeping in mind the investment horizon, liquidity requirements etc.

A range of acceptable holdings under each asset class is determined at the investment policy level. The **asset allocation** primarily takes into account, the investment objectives, regulatory issues and the likely risk return matrix to obtain a potential return which is the highest achievable for the risk that is assumed. Within the strategic asset allocation, the fund managers determine the weights of the various asset classes; primarily factoring in the developing market scenarios.

Based on the investment of objectives of each fund option, a rigorous **security selection** process is followed. The fixed income fund manager identifies cheaper securities across the yield curve and builds a basket of securities to arrive at the optimum level of yield within the range of pre-determined 'duration' for the entire portfolio after paying particular attention to the liquidity position and the liquidity premium on the securities. An active fund management style is followed on the equity portfolios. A core portfolio of stocks is first created driven by a top-down approach and a research based bottom-up stock selection method is followed.

Benchmarks are pre-determined for each fund based on the most appropriate indices available in the market or by constructing proxy benchmarks out of multiple indices. Performance of each fund is continuously tracked based on the benchmarks and recalibrated.

A statistical analysis is carried out to determine that the **risk levels** are in tune with the risk appetite of the particular fund. Statistical tools such as the standard deviation and risk-adjusted return measures such as the Sharp ratio are calculated in order to compare the returns generated per unit of risk vis-à-vis benchmarks.

The investment policy has been designed by the **Board** to cover regulatory guidelines, the various product investment objectives, risk appetite strategic asset allocation and the investment style. It is ensured that the portfolio is always kept compliant with the relevant regulations. Our rigorous process and risk/compliance controls are well documented.

Gross Fund Return

Gross return for a fund is defined as the return calculated on an NAV basis plus the fund management fees which are debited periodically to the fund. We calculate gross fund returns in order to give uniformity while evaluating fund management performance as the fund management fees vary from company to company. Fund management charges are a matter of policy decision by the top management of a life fund Insurance Company. Hence, even if two funds from two different fund management companies give the same returns, the returns may not reflect that if they are calculated on an NAV basis.

We shall highlight this with the help of an example.

Reliance Life Insurance

Balanced Fund
NAV based Return=11.50 %
Fund Management Fee=2%
Gross Fund Return=13.50%

XYZ Insurance Company

Balanced Fund
NAV based Return=10.50%
Fund Management Fee=3%
Gross Fund Return=13.50%.

As seen above, though the gross return of both the companies were same, Reliance Life Insurance showed a higher NAV based return as the fund management fees were lower. Please note that the returns as given in The Analyst for all funds are computed on a gross basis.

✓ Gross Fund Return

Benchmark Return

A benchmark is a standard against which the performance of an investment can be measured. Benchmarks are pre-determined primarily on the basis of the asset allocation structure of the fund.

✓ Benchmark Return

Benchmarks can be readily available in the market or have to be constructed. The CNX Nifty is a readily available benchmark for our equity portfolio manager as the equity fund primarily invests in equities.

✓ Fund Standard Deviation

However, the benchmark for the Growth Fund of Reliance Life Insurance has been constructed as 60% of CRISIL Short Term Bond Index and 40% of CNX Nifty as the asset allocation of the growth fund is 60% of debt and 40% of equity. (Please refer to the Growth Fund page of The Analyst).

✓ Fund Sharpe Ratio

Fund Standard Deviation

Risk of investing in a fund is identified by the volatility of the fund's periodic returns. Standard deviation measures the volatility of the fund's returns for a given time period.

In other words, Fund Standard Deviation for a particular time period gives us the deviation from the mean returns, that has occurred for that fund during that time period. For e.g. let us assume that the Balanced Fund has generated an average (mean) return of 11.55% for the last 2 years and that the corresponding standard deviation was 4.44%. That means that during the last 2 year time period, the balanced fund return varied between 15.99% (i.e. 11.55+ 4.44) and 7.11% (i.e. 11.55-4.44) during 65% of the time.

Higher the standard deviation, the greater the volatility, and therefore, the greater the risk of investing in that fund.

Thus, an investor has more information available at his disposal to evaluate the quality of performance of the fund and how volatile its returns are.

To carry it a step further, it is highly unlikely that a fund's return in any one year will be exactly the average. Rather, it will always be either higher or lower than the average. Thus, standard deviation teaches us to look beyond the "average annual return" figures that are touted by investment advisors.

Fund Sharpe Ratio

Sharpe ratio of a fund tells us how much return the fund has been able to generate per unit of risk. The higher the Sharpe Ratio, the better the performance of a fund from a risk point of view.

The excess return generated by a fund for a particular time period is first calculated by subtracting the risk free rate from the rate of return generated by that fund during that time period. Dividing this result by the standard deviation of the fund return during that time period, one can obtain the Sharpe ratio.

Sharpe Ratio = Excess return / Annualized standard deviation of fund return

The "risk-free return" is the annualized return currently available on "risk-free" investments. This is usually assumed to be the return on a short government security like Treasury bill. A government security is sovereign credit which is the nearest to a risk free asset that one can get. For our calculations of the Sharpe ratios for all funds as given in the Analyst, we have assumed this risk free rate of interest to be at 5%.

We shall assume that 9.85% was the annualized gross return for a 3-year time period for the balanced fund, 5% p.a. was the assumed risk free rate of return as discussed above and 4.14% p.a. was the standard deviation of this 3-year return. The Sharpe ratio can be calculated as follows:

$$(9.85-5)\%/4.14\%=1.17.$$

The Sharpe ratio tells us whether the returns of a portfolio are due to smart investment decisions or a result of excess risk. This measurement is very useful because although one portfolio or fund can reap higher returns than its peers, it is only a good investment if those higher returns do not come with too much additional risk. The greater a portfolio's Sharpe ratio, the better its risk-adjusted performance has been.

Benchmark Sharpe Ratio

Just as the fund returns are compared to a benchmark return, the Sharpe ratio of the fund is also compared to the benchmark's Sharpe ratio in order to evaluate the risk-adjusted performance. In our example above, let us assume that the benchmark Sharpe ratio of the balanced fund for the last 3 years is 0.98. This means that over a three-year time period, the Balanced Fund of Reliance Life Insurance has given a higher risk-adjusted return than the comparable risk-adjusted return provided by the constructed benchmark.

While calculating the benchmark Sharpe ratio of 0.98, let us assume that 9.10% was the annualized gross return provided by the constructed benchmark for the balanced fund for the last 3-year time period, 5% p.a. was the assumed risk free rate of return, and 4.21% p.a. was the standard deviation of the 3-year benchmark return.

The benchmark Sharpe ratio for the Balanced Fund for the last three years has been calculated as follows: $(9.10-5)\%/4.21\%=0.98$.

Modified Duration of Debt Portfolio

The value of a fund's debt portfolio is sensitive to changes in interest rates. When interest rates rise, bond prices fall, and vice versa. Generally, a debt portfolio comprising of bonds with higher maturities will have a higher price fluctuation than a portfolio comprising of bonds with lower maturities. Modified duration, indicates the sensitivity of the value of the debt portfolio to any given change in interest rates. Modified Duration is derived from Duration, which represents a weighted average of the time periods to maturity.

Modified Duration gives one an immediate rule of thumb -- the percentage change in the price of a bond is the duration multiplied by the change in interest rates. So, if a bond has duration of 10 years and interest rates fall from 8% to 7.5% (a drop of 0.50 percentage points), the bond's price will rise by approximately 5% (i.e. $10 \times 0.50\%$).

Let us assume that the modified duration for the Balanced Fund is 2.03. If interest rates drop from 8% to 7.5%, the value of this debt portfolio will rise by 1.015% (i.e. $2.03 \times 0.50\%$). Similarly, when interest rates rise from 8% to 8.5%, say, the value of this debt portfolio will fall by 1.015%.

Fund Beta

Beta measures the risk of a security (say a particular stock) in relation to its broad market. The broad market is generally defined as the specified benchmark index. The Beta assigned to the benchmark index is 1. Beta of the stock describes the sensitivity of the price of the stock to the benchmark index. (For the more statistically inclined readers, Beta is the slope of the regression line). It is generally calculated for equity portfolio/funds.

If a stock has a beta of 1, that stock is likely to generate the same returns as the market. If the beta of a stock is more than 1, it means that the stock is likely to give higher returns compared to the market but also at a higher risk as compared to the market. For instance, a stock with beta of 1.2 means that when the market, say Nifty, gives a return of 10%, that stock is likely to generate returns of 12% (i.e. $1.2 \times 10\%$). Similarly, a low beta stock has given lower returns compared to what the market has delivered for a particular time period. For e.g. for a stock with beta of 0.80, if the Nifty gives returns of 10%, the stock is likely to give returns of only half of that, i.e. 8%. (i.e. $0.80 \times 10\%$)

Now we shall see the impact of these two stocks when the market falls. When the Nifty gives negative returns of 10%, i.e the market falls by 10%, the price of the stock with beta of 1.2 will fall by 12%. However, though the price of the stock with the low beta of 0.8 will also fall when the market falls, it will not fall as much as the market. If the market falls by 10%, the price of this scrip will fall only by 8%.

The fund beta is nothing but the betas of individual stocks in the equity portfolio multiplied by the weight of that stock in the portfolio. If a fund has a high beta, the equity portfolio of that fund is aggressive and tilted towards high beta stocks and vice versa. Please note that the betas of individual stocks as given in the Equity Fund page of the Analyst have been calculated based on the available prices of the stocks on the NSE for the last 1-yr period.
